

## Void Stasys 3

The Stasys 3 mk2 mid hi touring enclosure is designed to give system operators quick and simple solution to large scale sound reinforcement. Each enclosure comes with multiple point flyware, allowing quick system setups and accurate arraying. For more info and pictures click [read more](#).

The design is the distillation of a lifetimes work. Most of the technology incorporated in the mk2 version has never been attempted before and is a radical departure from the norm. At the heart of the design is the 'waveformer'. Sound waves enter the horn at varying distances from the transducer via the centrally mounted 'waveformer'. The distance depends on the frequency and also the radiation pattern of the transducer. New types of transducers were developed that emit different frequencies from different locations around their radiation surface. All these locations are then channelled to the 'waveformer' and emitted at a precise distance down the horn.
